No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                      US-09-715-876-8

            - 1 SUBCELLULAR LOCATION: Secreted.
- 1 TISSUE SPECIFICITY: COLON, SMALL INTESTINE, COLONIC TUMORS,
- 1 TISSUE SPECIFICITY: COLON, SMALL INTESTINE, COLONIC TUMORS,
- 1 FTM: ALL CYSTEINE RESIDUES ARE INVOLVED IN INTRACHAIN OR
- 1 TISCHAIN DISGULFIDE BOONDS (BY SIMILARITY).
- 1 FOLYMORPHISM: THE NUMBER OF REPEATS IS HIGHLY POLYMORPHIC AND
- 1 SIMILARITY: THE N-TERMINAL DOMAINS SOME SIMILARITY TO THAT
- 1 SIMILARITY: CONTAINS 2 VWFC DOMAINS.
- 1 SIMILARITY: CONTAINS 1 C-TERMINAL CYSTINE KNOT-LIKE DOMAIN (CTCK).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                    The alpha-aggluthin is used in a method to immobilise enzymes to a microbial cell wall. The coding sequence is used in the production of a recombinant polyvuclectide which comprises a structural gene encoding a protein with catalytic activity and at least part of a gene encoding at least the C-terminus of a protein capable of from confing in a enkaryotic or protein capable of ragent or protein is selected from alpha aggluthin, AGA 1, FLO 1, major cell wall protein of lower eukaryotes or a proteinase of lactic acid bacteria. The recombinant polynucleotide preferably also comprises a sequence encoding a signal peptide to ensure secretion of the expressed product. The signal peptide to ensure protein, alpha factor, alpha aggluthin, invertuse or inulinase, alpha-maylase of Bactilus or proteinases of lactic acid bacteria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The agglutination gene is called FLO1. Saccharomyces cerevisiae includes an agglutination gene of 4.7 kb (FLO1b) and an agglutination gene of 2.6 kb (FLO1s). FLO1L is the inteat FLO1 gene on chromosome I, and FLO1s is the FLO1L gene with a portion of the ORF deleted in frame. FLO1L imparts a relatively strong agglutinative property to the host yeast into which it is introduced, while FLO1s imparts a weaker agglutinative property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  104 nwgckgmgacsnsgglaywstdlfgfyttptnv-tlemtgyflppgtgsytfkfatvdds 162

                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the GP900 glycoprotein of the protozoan cryptosporidium parvum, DNA encoding it, GP900 fragments, and fusion proteins comprising GP900 fragments. The invention also relates to the administration of GP900 or fragments thereof to a host to elicit anticant to antibody production, and to a method of Cryptosporidiosis treatment or prophylaxis comprising administration of anti-GP900 antibodies to an individual. Cryptosporidium parvum GP900 and GP900 fragments are able to competitively inhibit sporozoite or merozoite attachment or invasion, and care also useful for the generation of anti-GP900 antibodies. The additionally inhibit sporozoite or merozoite attachment/invasion and additionally inhibit the binding of GP900 injugands to GP900. GP900 antibodies. The additionally inhibit the binding of GP900 injugands to GP900. GP900 cortens, fragments and antibodies may therefore be used to treat or protosporidioss. Infection with Cryptosporidium is a common cause of diarrhoea in humans and causes life-threatening diarrhoea in munocompromised persons. Cryptosporidiosis can be contracted from contaminated municipal water supplies (e.g., public swimming pools). It is also a cause of disease in animals, resulting in financial losses in addiction of the parasite in the environment. The present sequence represents the GP900 protein of the lowa isolate of Cryptosporidium
                                                                                                                                                                                                                        GP900; Iowa isolate; glycoprotein; antibody; cryptosporidiosis; competitive inhibition; attachment; invasion; ligand binding; sporozoite; merozoite; diarrhoea; protozoacide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New GP900 protein fragments and fusion proteins of Cryptosporidium parvum, useful for detecting the presence of the parasite, and diagnosing or treating Cryptosporidium infections by competitive inhibition of the function of GP900

The invention relates to the GP900 glycoprotein of the protozoan Cryptosporialum parvum, DNA encoding it, GP900 fragments, and fusion proteins comprising GP900 cragments. The invention also relates to the administration of GP900 or fragments thereof to a host to ellcit anticorportation of GP900 or fragments thereof to a host to ellcit anticorportation of GP900 antibodies to an individual cryptosporialum parvum GP900 and GP900 antibodies to an individual cryptosporialum parvum GP900 and GP900 fragments are able to competitively inhibit sporozoite or merozoite attachment or invasion, and are also useful for the generation of anti-GP900 antibodies. The are also useful for the generation of anti-GP900 antibodies. The are also useful for the pencation of merozoite attachment or invasion, and antibodies also inhibit sporozoite or merozoite attachment or invasion, and additionally inhibit the binding of GP900 ligands to GP900 appending and antibodies may therefore be used to treat or prevent cryptosporialosis. Infection with Cryptosporialum is a common cause of diarrhoea in humans and causes life threatening diarrhoea in munucoompromized persons. Cryptosporialosis can be contracted from conteminated municipal water supplies, (e.g., public swimming pools). It is also a cause of disease in animals, resulting in financial losses in agriculture. GP900 fragments of Cryptosporialum parvum infections and for the exciton of the parasite in the environment. The present sequence represents a portion of the GP900 protein of the NINC isolate of Cryptosporialum parvum.
